Title: Physicochemical Investigation of Low Temperature Tar

Original

Periodical: Z badan nad fizykochemią smoły nizkotemperaturowej, Przem. chem., 1955, 11, No 10, 575-579; Polish, Russian and English resumés

Abstract: Presented are the characteristic and composition of semicoking coal tar. Distillations of crude oil are used as examples in considering the possibility of formation of various types of azeotropic mixtures. An attempt is made to effect partial separation of fractions by azeotropic distillation with phenol and acetic acid. Noted are the differences between petroleum, high and low temperature tars from the standpoint of the formation of polyazeotropic mixtures. It is shown that acetic acid forms with mesitylene an azeotropic mixture boiling 0.03° lower than acetic acid.

✓ 1058 SINGULAR POTENTIALS IN RELATIVISTIC EQUATIONS OF MOTION. J.W.G. VAN DER POL. Acta phys. Polon. Vol. 14 No. 4, 233-44 (1956).
It is shown that in the particle moving in external field of pure relativistic origin for scalar and pseudoscalar attractive character of the potential, they prevent the particle from coming too near to the singularity of the potential. An interaction potential for two nucleons interacting through the pseudoscalar field has been obtained. An interesting feature of this potential is a strong repulsive term acting at small distances between the nucleons.

Orig Pub : Bull. Acad. polon. sci. Ser. sci. metho., astron., et phys., 1958, 6, No 1, 51-55

Abstract : The author calculates the longitudinal polarization of muons, arising during the decay of moving pions. It is assumed that the pion that decays at rest gives a fully longitudinally polarized muon. The magnitude of the longitudinal polarization λ turns out to be strongly dependent on the kinetic energy of the pion and on the angle between the momenta of the pion and the muon. Graphs are given for this dependence. The longitudinal polarization, averaged over all the directions of the emergence of the muon, is of the following form:

$$\lambda = 1 - 0.061 E_{\text{kin}}, \text{ where } E_{\text{kin}} \text{ is the kinetic energy of the}$$

Title : Transition Matrices for Reactions Between Two Bosons and
Two Fermions

Orig Pub : Bull. Acad. polon. sci. Ser. sci. math., astron. et phys.,
1958, 6, No 7, 477-479, XXVIII

Abstract : An explicit form is constructed for the structure of the
transition matrix M for five different types of reactions
between two bosons and two fermions, when the spins of
the fermions are equal to one half, and the spins of the
bosons are respectively 0 and 0, 1 and 0, and 1 and 1.
The consequences of the gauge invariance are considered
for the structure of the reaction matrix in the case when
one of the bosons is a photon. -- L.I. Lapidus

Gasoline from Low-Temperature Carbonization
Tar.

ORIG. PUB. : Roczn. chem., 1958, 32, No 5, 1183-1188

ABSTRACT : Description of an azeotropic method developed by the Institute of Physical Chemistry (Polish People's Republic) for investigation of light gasoline from low-temperature carbonization tar. Fractions of boiling range 60-150°, obtained on fractionation of gasoline, are distilled in the presence of compounds forming azeotropic mixtures (AM) with aliphatic hydrocarbons and naphthenes. Low boiling fraction containing benzene is fractionated with excess acetone, middle fraction containing toluene -- with excess methyl alcohol, high boiling fraction containing isomeric xylenes -- with excess pyridine. Thus, the corresponding ternary and quaternary AM are separated. The

AUTHOR: Werle, J.

TITLE: On some problems of the S-matrix formalism for unstable particles

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1962, 45, abstract 3A395 ("Bull. Acad. polon. sci. Ser. sci. math. astron. et phys.", 1961, v. 9, no. 3, 207 - 210, English; Russian summary)

TEXT: It is shown that a term iM , whose matrix element determines the probability of decay for one of the particles, is formally introduced into the phenomenological S-matrix: $S = 1 + iM + iT + iR$ suggested by the author in earlier papers (RZhFiz, 1959, no. 3, 4908; no. 6, 12206) for an arbitrary transformation of particles into others, and developed on the explicit assumption of a definite mass of the particles concerned. Then, the direct use of the condition of unitarity $SS^+ = 1$ reveals a number of contradictions in the suggested scheme of S-matrix formalism. For the process $\Sigma^- \rightarrow n + \pi^-$ (1), in particular, the system of equations is obtained on the basis of the condition of unitarity which connects the matrix elements M , T ($n + \pi^-$ scattering), R (the remaining admissible elements for Σ^- , n, π^- processes), in which some of the terms turn out to be infinite.

Card 1/2

8/058/62/000/003/024/092
A061/A101

On some problems of the...

The contradiction concerned is explained by the disregard of the absence of a definite mass of Σ in the scheme (due to instability). To eliminate the infinite terms, it is suggested that the mass (m_1) of the Σ -particle be formally considered variable, and all quantities be functions of m_1 (the specific dependence on m_1 is not presented), and that the system of equations be generalized for the matrix elements by integrating the initial system over m_1 . The system of equations so obtained is solved on a rough model assumption, and the resulting solution is the one known already earlier for the reaction of type (1). It is further suggested that the rigorous system of equations obtained be used to study the correctness and the range of applicability of the approximations applied to obtain the solution.

ORIG. PUB. : Farmacia (Romania), 6, No 3, 229-232 (1958)
ABSTRACT : The authors have developed a colorimetric method for the determination of anesthesin [ethyl amino-benzoate (I)], based on the diazotization of I and coupling of the products obtained with β -naphthol in aqueous acetone. The advantages of the method are the production of a dye soluble in aqueous acetone, elimination of the need for extraction of the dye with a solvent which is immisible with water, and the possibility of the determination of small concentrations of I. The

3. Electronic time measuring device — J. Werner,
(Méres és Automatika — Vol. 2, 1954, No. 7, pp. 210-
213, 3 ill.)

The paper deals with a direct reading electronic time-measuring device covering the millisecond range. The beginning and the end of the interval to be measured are both signaled to the instrument by an impulse. The measuring instrument produces a voltage characteristic of the time to be measured which is read on a d-c valve voltmeter calibrated in time units. The relationship between the voltage and the time interval is determined by calibrating measurements. The reference time is a steady signal of known frequency, e.g. the duration of one cycle of a sinusoidal wave, but may also be a full cycle. A single half cycle of a steady sine wave is cut out by a circuit consisting of two bistable multivibrators and this is used to control the measuring instrument. Finally, a practical connection diagram is given for the measurement of the transit time of relays.

Epidemiol., Lublin - PRZEGL. EPIDEM. 1958, 12/2 (123-126)
Epidemic foci of typhoid appearing in 1956 in Lublin Province were investigated
by phage-typing of strains isolated from patients and persons sharing houses with
patients. The results obtained, along with data of the routine epidemiological in-
vestigation, were extremely useful in the epidemiological analysis of the foci. This
method permitted establishment of the probable source of infection in 3 cases. In
one case, links between 2 remote foci were established.

Title : Chemistry of Carbonyl Cyanide. III. Mechanism of Reaction Between Carbonyl and Olefins Containing CH-C≡C Group.

Orig Pub : Bull. Acad. polon. sci., 1957, cl. 3, 5, No 9, 923-925

Abstract : The reactions of $\text{CC}(\text{CN})_2$ (I) with pentene-1, pentene-2, trimethylethylene (II) and α -methylstyrene (III) were studied. The reactions proceeds with 2 moles of I similarly to the formerly described interaction of I with allylbenzene (RZhKhim, 1957, 37584) and result

point 75 to 76.5°, - , - . In the cases of II and III
in the cold, the following products of reaction with
1 mole of I are forming: $\text{CH}_2\text{-C}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{C}(\text{CN})_2\text{OH}$

(VI) and $\text{CH}_2\text{-C}(\text{C}_6\text{H}_5)\text{CH}_2\text{C}(\text{CN})_2\text{OH}$ (VII), which are able

to react with I further producing IV and V. VI and
VII split off HCN at heating and produce α -ketonitriles
 $\text{CH}_2\text{-C}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{COCN}$, yield 57%, boiling point

45 to 46/10 mm, $d_4^{20} = 0.9300$, $n^{20}\text{D} = 1.4330$, and
 $\text{CH}_3\text{C}(\text{C}_6\text{H}_5)\text{-CHCOCN}$, yield 80%, melting point 40 to 42°.

A reaction mechanism based on these transformations is
proposed (see the scheme).
